

BRD - Civil Contractor Management Application

Document Version: 1.0

Status: Draft for Client Review **Date:** 23 August 2026

The contractor primarily undertakes residential building construction work.

The business typically has:

- Approximately 20–30 workers.
- Workers such as masons, helpers and other construction workers.
- Workers employed for periods of 6–12 months or permanently.
- One supervisor.
- Approximately 5–8 construction sites operating at the same time.
- Workers moving between sites depending on daily requirements.
- Workers may be assigned to different sites during the same day. Site allocation may sometimes be decided during the second half of the day based on ad-hoc work requirements.

The contractor currently needs to manage:

- Worker attendance
- Worker earnings
- Weekly advances
- Salary payments
- Additional-work payments
- Site-wise labour costs
- Site expenses
- Client bills
- Money received from clients
- Cash and Bank balances
- Project-wise financial position

The application will bring these records into one place.

The main objectives of the application are to allow the contractor to easily answer questions such as:

About workers

- Who worked today?
- Which site did a worker work at?
- How many days has a worker worked?
- How much has the worker earned?
- How much has already been paid?
- How much advance has been given?
- How much is still payable?

About sites

- How much labour has been spent on a site?
- How much other expense has been incurred?
- How much money has been received from the client?
- How much is still pending from the client?
- What is the financial position of the site?

About the contractor's money

- How much money is available in Cash?
- How much money is available in Bank?
- How much has been paid to workers?
- How much has been spent on sites?
- How much has been received from clients?

Worker Management

The application should maintain basic information for each worker.

The required information is:

Information	Requirement
Worker Name	Required
Mobile Number	Required
Daily Wage	Required

Workers may have different daily wages depending on their role and agreed rate.

For example:

Worker	Daily Wage
Ramesh	₹800
Suresh	₹750
Mahesh	₹900

The application should use the worker's applicable daily wage when calculating attendance earnings.

Attendance Management

Attendance is one of the most important functions of the application.

Attendance should be recorded:

Worker → Date → Site → Attendance

A worker can have multiple attendance entries on the same date.

This is necessary because a worker can work at more than one site in a day.

Example

Ramesh works:

Site	Attendance
Site A	0.5 day
Site B	0.5 day
Total	1 day

The contractor or supervisor can enter attendance at any time.

Previous dates do not need to be locked.

Attendance can be changed or deleted whenever required.

Attendance Types

The application should support the following attendance values.

Business Term	Value	Meaning
Absent	0	No payment
Half Day	0.5	Half day's wage
Full Day	1.0	Normal day's wage
Savai	1.25	Overtime
Dedhi	1.5	Overtime

Savai and Dedhi are business terms used by the contractor for overtime.

Example

If a worker's daily wage is ₹800:

- **Full Day:** $₹800 \times 1 = ₹800$
- **Half Day:** $₹800 \times 0.5 = ₹400$
- **Savai:** $₹800 \times 1.25 = ₹1,000$
- **Dedhi:** $₹800 \times 1.5 = ₹1,200$

Attendance Across Multiple Sites

A worker can work at multiple sites on the same day.

For example:

Ramesh — 23 August

Site	Attendance	Labour Cost
Site A	0.5	₹400
Site B	0.5	₹400
Total	1.0	₹800

This allows the application to calculate labour cost separately for each site.

Savai/Dedhi can also be recorded as part of the worker's attendance.

Worker Earnings

Worker earnings are primarily calculated from attendance.

The basic calculation is:

Daily Wage × Attendance Value = Attendance Earnings

The application should also consider:

- Previous unpaid earnings
- Current attendance earnings
- Additional work
- Advances
- Salary payments

The worker's current payable amount should therefore reflect the complete history up to the selected date.

Existing Balance

An existing balance means unpaid earnings carried forward from previous periods.

For example:

Description	Amount
Previous unpaid balance	₹5,000
Current earnings	₹20,000
Payments made	₹10,000
Current balance payable	₹15,000

The application should carry unpaid worker earnings forward.

Additional Work

Additional work is separate from attendance.

It should not be treated as Savai or Dedhi.

Additional work should have:

- Worker
- Amount
- Date
- Description/reason

Example

Ramesh:

Earnings	Amount
Attendance earnings	₹20,000
Additional work	₹3,000
Total earnings	₹23,000

Additional work should remain separately visible in worker reports.

Worker Payments

The contractor frequently gives workers money during the week, particularly on Friday or Saturday.

These payments may be:

- Advance
- Salary payment
- Additional-work payment

When making a payment, the contractor should simply select the payment type.

A worker payment should record:

- Worker
- Date
- Amount
- Payment type
- Reason — optional
- Payment method
- Payment details — optional
- Site

The contractor should manually select the site when making a worker payment.

No payment proof is required.

Advances

Advances are commonly given to workers for household expenses.

Typical examples are ₹2,000–₹3,000 paid on Friday or Saturday.

There is no maximum advance limit.

The application should allow advances without restriction.

Example

- Worker: Ramesh
- Amount: ₹3,000
- Payment Type: Advance
- Reason: Household expenses
- Date: 22 August
- Payment Method: Cash

- Site: Site A

The advance should reduce the amount eventually payable to the worker.

Salary Payments

Workers may receive money in different ways.

A payment may be:

- An advance before salary calculation
- Part payment after a month is completed
- Full payment for a month
- Full payment for a specific date range
- An intermittent salary payment

The application should not assume that workers are paid only once per month.

The contractor should be able to record payments whenever they are made.

Worker Payment and Labour Cost

The application should keep worker payments and labour cost as separate concepts.

Labour Cost

Labour cost is based on attendance.

If Ramesh works:

Site A = 0.5 day

Daily wage = ₹800

Site A labour cost is:

$$₹800 \times 0.5 = ₹400$$

Worker Payment

A worker payment represents actual money given to the worker.

For example:

Ramesh → ₹5,000 → Advance → Site A → Cash

The payment and labour cost may happen at different times.

This separation is important because a worker may earn ₹20,000 but receive ₹2,000–₹3,000 every Friday.

The application should not count the same money twice as project cost.

Worker Balance Example

The application should show a clear worker calculation.

Example

Particular	Amount
Attendance earnings	₹20,000
Additional work	₹3,000
Total earnings	₹23,000
Less: Advances	₹7,000
Less: Salary already paid	₹5,000
Balance payable	₹11,000

Additional work remains separately identifiable.

For example:

- Salary earnings = ₹20,000
- Advance = ₹5,000
- Salary remaining = ₹15,000
- Additional-work payment = ₹3,000

Projects / Sites

The contractor may have approximately 5–8 sites at the same time.

The application should allow multiple projects/sites to be maintained.

No unnecessary project information is required at this stage.

The site/project should be available for:

- Attendance
- Labour cost
- Worker payments
- Expenses
- Bills
- Client receipts
- Site/project reports

Client Bills

For each bill, the application should record:

Information
Bill Date
Bill Amount
Amount Received
Date Received
Payment Method
Balance
Remarks

The pending amount should be calculated automatically.

Pending Amount = Bill Amount – Total Amount Received

Multiple Receipts Against One Bill

A single bill may be paid by the client in multiple installments.

Each receipt should be recorded separately.

Example

Bill Amount: ₹5,00,000

Date	Amount Received	Payment Method
10 Aug	₹2,00,000	Bank
20 Aug	₹1,50,000	Bank
30 Aug	₹50,000	Cash
Total	₹4,00,000	Pending: ₹1,00,000

When money is received from a client, the transaction should be recorded as:

Project → Bill → Amount Received → Cash/Bank

The application should automatically increase the appropriate Cash or Bank balance.

Site Expenses

The contractor wants to record site expenses simply.

There should be no fixed expense categories.

The expense description should be free text.

Each expense belongs to one site only.

An expense should record:

- Site
- Amount
- Description
- Date
- Paid by
- Payment method

Paid by can be:

- Contractor
- Supervisor

Site A → ₹2,500 → Excavator fuel → 23 Aug → Contractor → Cash

Another example:

Site B → ₹1,500 → Food and tea for workers → 23 Aug → Supervisor → Cash

Cash and Bank

The application should maintain separate balances for:

- Physical cash held by the contractor.
- All non-cash payments.

For the purpose of this application, Bank includes:

- Bank transfer
- UPI
- Cheque
- Other non-cash payments

There is no need for separate UPI tracking at this stage.

Financial Movement

The application should automatically update Cash and Bank balances.

- Cash/Bank increases.
- Cash/Bank decreases.
- Cash/Bank decreases.

This should allow the contractor to see the current money position without manually calculating it.

The application should support entering the contractor's existing Cash and Bank balance when the business is first set up.

Site-Wise Project Costing

The application should provide project costing based on:

- Labour cost from attendance
- Other site expenses
- Client amounts received
- Amount pending from client

The contractor should be able to see the financial position of each site.

For example:

Particular	Amount
Client amount received	₹8,00,000
Labour cost	₹2,50,000
Other expenses	₹1,20,000
Remaining position	₹4,30,000

The detailed report should also show the bills, receipts, labour and expenses behind these figures.

Dashboard

The application home screen should provide a quick overview.

The dashboard should show:

- Today's Attendance
- Total Worker Payments
- Site-wise Balances
- Total Site Expenses
- Total Money in Cash
- Total Money in Bank

The dashboard should be simple and useful for daily business decisions.

Worker Report

The contractor should be able to view a worker report for a selected period.

Attendance

Attendance should be shown site-wise.

Example:

- **Site A:** 8 days
 - Normal workdays: 7

- Savai/Dedhi and Half Day dates should be displayed separately.
- **Site B: 7 days**
 - Normal workdays: 6
 - Half Day: 12 Aug
 - Savai: 18 Aug
- **Site C: 3.5 days**
 - Normal workdays: 3
 - Half Day: 20 Aug

The report should make it easy to understand both the total attendance and exceptional attendance dates.

Worker Earnings Report

The worker report should show:

Particular	Amount
Normal earnings	₹14,800
Savai/Dedhi earnings	₹2,400
Additional work	₹3,000
Total earnings	₹20,200
Advances	₹6,000
Salary payments	₹5,000
Balance payable	₹9,200

Site / Project Report

The site/project report should show:

Client

- Bill-wise amounts
- Amount received against each bill
- Total amount received
- Amount pending from client

Labour

- Worker-wise labour cost
- Total labour cost

Expenses

- Date
- Description
- Amount
- Paid by
- Payment method

Overall Site Position

The contractor should be able to understand:

Money received from client

– Labour cost

– Other site expenses

= Site position

Worker payments allocated to a site should also be available for viewing, but should not be added again as labour cost when labour cost has already been calculated from attendance.

Record Management

Both contractor and supervisor should be able to add, edit and delete records.

This applies to:

- Workers
- Attendance
- Worker payments
- Advances
- Additional work

- Sites/projects
- Bills
- Client receipts
- Site expenses

Previous attendance dates do not need to be locked.

Initial Version — Included

The first version should include:

- Worker management
- Daily wage management
- Site management
- Site-wise attendance
- Multiple attendance entries per worker per day
- Full Day
- Half Day
- Savai
- Dedhi
- Worker earnings calculation
- Previous unpaid balance
- Advances
- Salary payments
- Additional-work payments
- Site-linked worker payments
- Client bills
- Multiple receipts against bills
- Client payment tracking
- Site expenses
- Cash balance
- Bank balance
- Worker reports
- Site/project reports
- Dashboard

Initial Version — Not Included

The following are not required in the first version:

- Login/authentication
- Multiple businesses
- Different user permissions
- Notifications
- Alerts
- Payment proof
- Receipt/photo uploads
- Offline working
- Server synchronization
- Equipment inventory
- Material inventory
- GST/tax management
- Formal accounting/bookkeeping
- Bank integration
- UPI integration
- Automated payment collection
- Advanced analytics

These may be considered in future versions.
